Application as Senior C++/Python Backend Systems Engineer

Dear Recruiting Team,

When enterprise platforms hit performance bottlenecks, memory leaks threaten system stability, or legacy codebases require deep architectural refactoring, feature-level patch fixes are no longer enough. What is needed is an engineering approach built on low-latency execution, determinism, and system safety. Exactly at this intersection—combining low-level systems engineering, mathematical rigor, and modern C++/Python backends—I bring my core expertise.

With an M.Sc. in Scientific Computing and over 9 years of professional engineering experience across enterprise search engines, core desktop modules, and embedded real-time systems, I offer the technical depth required to build and optimize high-throughput architectures for **Lokaler_Testlauf**.

Key alignment with your engineering needs:

- **Core Systems & Low-Level Engineering:** Applying Modern C++ (17/20), C, Python, and CUDA to optimize memory-critical and latency-sensitive backends, including root-cause analysis of memory leaks and race conditions.
- **High-Throughput Enterprise Backends:** Refactored search core modules, optimized indexing data pipelines, and reduced technical debt in production backends at Mindbreeze, Untis, and EYYES.
- **Measurable Process Optimization:** Built automated performance-verification frameworks, reducing release verification cycle time from 10 days down to 3 days.

Lokaler_Testlauf stands out to me due to *Local compilation with optimized tech stack.*. I am eager to bring my pragmatic engineering mindset and problem-solving focus to your team to help scale complex systems sustainably.

I look forward to discussing how my background aligns with your technical requirements in an interview.

Sincerely,

Markus Gruber, M.Sc.
