Application for AI Automation Engineer (f/m/x)

Dear Ms. Schwarzl-Moser,

When high-throughput enterprise systems hit performance boundaries, low-level memory leaks compromise uptime, or legacy codebases require deep architectural refactoring, feature development alone is no longer enough. What is needed is an architecture engineered for low latency, determinism, and execution stability. This exact intersection—combining low-level systems engineering, mathematical rigor, and modern C++/Python backends—is where I leverage my expertise.

Holding an M.Sc. in Scientific Computing and over 9 years of industry experience across enterprise search engines, core desktop applications, and embedded real-time systems, I bring the technical depth required to design high-performance core systems for **MP Corporate Finance**.

Why my background aligns with your engineering position:

- **Core Systems & Low-Level Engineering:** Operating extensively with modern C++ (17/20), C, Python, and CUDA, I optimize memory- and latency-critical backends. Root-cause analysis of memory leaks, race conditions, and system bottlenecks is part of my daily practice.
- **High-Throughput Enterprise Backends:** At Mindbreeze, Untis, and EYYES, I refactored core search modules, optimized indexing pipelines, and eliminated critical technical debt in production backends.
- **Measurable Process Optimization:** By engineering automated performance testing frameworks, I reduced release verification cycles from 10 working days down to 3 working days.

MP Corporate Finance stands out to me in particular due to *MP Corporate Finance is one of Europe's leading mid-market MA boutiques, where AI-powered automation tools are deployed on live cross-border transactions from day one.*. I would be glad to bring my hands-on problem-solving approach to your engineering team to scale complex systems sustainably.

I welcome the opportunity to discuss your technical requirements in a personal interview.

Sincerely,

Markus Gruber, M.Sc.
